

Remove n^{th} node from end:-

$(1) \rightarrow (2) \rightarrow (3) \rightarrow (4) \rightarrow (5), n=2$

- $\rightarrow$ At first move 'first' pointer by 'n' from head.
- $\rightarrow$ Check if 'first' is 'null', that means first element has to be deleted, delete it.
- $\rightarrow$ Then move both 'first' and 'second' till second.next != null.
- $\rightarrow$ You will reach at the element to be removed.

Suppose A and B are walking, B is 'n' steps ahead, so when the reach end, still there will be diff of 'n' steps b/w A and B.

Total to be covered $\rightarrow x$

A at $\rightarrow x$
B at $\rightarrow 0 \quad \rightarrow \text{diff} = n$

At the end, A at $\rightarrow x$

B at $\rightarrow x - n$

TC $\rightarrow O(n)$
SC $\rightarrow O(1)$
