

Intersection of Linked Lists:-

- Start moving two pointers t_1 & t_2 simultaneously.
- If they are equal, return.
- If one of them is at null node, move the pointer to opposite list's head.
- Again move simultaneously, if they meet between the nodes, else null.

TC $\rightarrow O(m+n)$
SC $\rightarrow O(1)$

- One list is bigger than other by 'd'.
- So by the time large pointer t_1 reaches start of opposite head, small pointer t_2 will already be ahead by 'd'.
